Defensible Space
Master Gardeners
October 18, 2007
Curriculum Objectives

- Identify information sources for local codes and regulations for defensible space
- Describe planning elements that reduce community wildfire risks
- Describe goals and tradeoffs relating to defensible space
- Describe techniques that can be used to reduce vegetation/fuels in Zone 2, and risks of removing too much vegetation
- Describe compliance procedures and considerations for hiring contractors
First Steps

- Determine applicable local codes
- Reconcile requirements from different stakeholders:
  - Homeowners
  - Local fire marshal
  - Multiple Species Conservation Program
  - Insurance, HOA and others
Consequences of Ignoring Defensible Space

Before wildfire

After wildfire
Large-scale Community Planning

- Buffers
  - Irrigated Green Belts
  - Roads
- Golf course
- Access
- Set-backs
Golf course built between homes and wildlands would provide better protection
Large-scale Community Planning

- **Access**
  - Two ways in, two ways out
  - Adequate width for two emergency vehicles
  - Adequate vegetation reduction adjacent to streets and roads
Inappropriate planting too close to road!

**Fire Access**

Roadways are wide enough (minimum of 24 feet) to accommodate multiple fire engines.

Width = 24 ft.
Site Location

- Canyon rim?
- In the middle of development?

Embers can still reach homes away from the edge of a sub-division!
Once a fire resistant home begins burning, any structure closer than 16’ is subject to the intense radiant heat given off by the burning home.
“Cut-and-Fill”

“Cliff Hanger”

“Safer” Hilltop View

Structure Position on Slopes
Set-backs

15' for single story structures
30' for two story structures

Help your home protect itself! Set-back from top of slope, makes a difference!
Set-backs also allow mitigation to be contained within property boundary and not on public land!
Defensible/Survivable Space

- **Goals:**
  - Reduce flame length and keep those flames from touching structure
  - Reduce radiant heat that the structure is exposed to
  - Allow emergency personnel room to maneuver, if present
  - Reduce adverse effects on native habitats
  - *(Start with the house, and move out!)*
Fifteen Reasons Why People Don’t…

1. I didn’t know there was a wildfire threat.
2. It’s not going to happen to me.
3. Fate determines whether my house survives.
4. It’s not my responsibility
5. If it was really important, my insurance agency would give me a break.
7. It’s wrong to cut trees.
8. It won’t look good.
Fifteen Reasons Why People Don’t…

9. I don’t like working outdoors.
10. I don’t have the time or money.
11. I don’t know what to do.
12. I don’t have an easy way to get rid of brush.
13. It’s against the law to remove vegetation.
14. I don’t own the property.
15. It won’t make a difference.

Other ________
Review of Fire Basics

- Fire needs three things to burn, and more importantly propagate

1. **Fuel:** Vegetation, wood decks, houses, gazebos, etc.

2. **Oxygen:** Fire will burn better in fuels where air can circulate; i.e. dead leaves still on the tree will burn better than leaves on the ground

3. **Heat:** fuels can ignite through one, or through a combination, of three ways:
Physics of Flammable Vegetation

- House ignites by radiation from plants burning next to combustible materials.
- House ignites by conduction when embers are generated by brush or landscaping, and land on combustible materials.
- Roofs, attics, eaves, windowsills, siding, decks, patio furniture are combustible materials.
What do you value in landscaping?

- Privacy
- Place to socialize
- Place to garden
- Wildlife habitat
- Reduce risks of house ignition by wildfire
- Low water and energy bills
- What else?
Multiple objectives/trade-offs

- Reduce risk of property ignition
- Reduce risk of embers generated by landscaping
- Reduce loss of habitat and backyard wildlife
- Reduce erosion, stormwater runoff, water quality degradation, and slope failure
- Minimize energy use (shade trees)
- Minimize water use (irrigation)
- Minimize costs to homeowner and community
Systems Approach for Defensible Space

- House design and materials
- Built landscape
- Planting arrangement
- Fire resistive plants
- Irrigation
- Pruning
- Habitat protection
- Erosion control
- Water conservation
Radiant Heat
Defensible/Survivable Space

- Requirements differ by jurisdiction – Check with local fire marshal – generally agreed at 100 feet
Defensible Space Zones

- Objectives are to reduce radiant heat
  - Vertical spacing to remove “ladder fuels” that allow ground fire to burn into shrub or tree canopies
  - Horizontal spacing to reduce spread of fire from one plant to the next

- Zone 1: 30 to 50 feet from structure
  - “Lean, Clean and Green”
  - Covered in November 1 class

- Zone 2: 100 feet from structure
  - More if fire official permits, due to steep slopes
Defensible/Survivable Space

Before Brush Management
Defensible/Survivable Space

First remove:
- Dead and Down
- Highly flammable species
Defensible Space Zones

Zone 1 = 35-50 Feet

Zone 2 = 50-65 Feet

Open Space = No Maintenance
Zone 2: Chaparral

- Remove dead and dying vegetation
- Prune lower limbs of shrubs to reduce vertical ladder fuels
- Reduce vegetation cover to 50%
  - Half of ground has living plant canopy
- Cut stumps to 6” or 18”
  - Depends on local code
- Retain roots (for erosion control)
Defensible/Survivable Space

- Is a well-maintained landscape, NOT cleared to mineral soil

>50% of soil should have living plant canopy
Example of pruned shrubs, Talmadge FireSafe Council, Fall 2007
Example of pruned shrubs, Talmadge FireSafe Council, Fall 2007
Zone 2: Brush Reduction

Before brush reduction

After brush reduction
Zone 2: Forest

- Remove dead and dying trees
- Prune limbs of mature trees to reduce ladder fuels
  - 10 feet up from the ground
  - Or 1/3 of live-crown height
- Prune limbs to keep 10 feet from chimney
- Prune limbs hanging over roof and gutters
Zone 2: Grassland

- Most are non-native, invasive weeds and grasses
  - Ignite easily
  - Fire spreads quickly
- Use equipment responsibly
  - Spark arresters on mowers, weed-whackers
  - Exhaust system and motors in good order
  - Lawnmower blades can spark fires on rocks
- Fire can start from vehicle exhaust pipes
Zone 0 (“House Ignition Zone”)

- Within 5 or 10 feet of structure
- Eliminate radiation that can ignite foundation elements
- No mulch, bark, or pine needles
- Use stones, decomposed granite
- Prune heavily to eliminate places for embers to land and ignite plants
- Remove lawn furniture, woodpiles, and trash
Brush Reduction Options

- Mechanical/physical
  - Crews
  - Chipping
  - Grazing (goats)
  - Bulldozers (NO!)
- Herbicides
- Prescribed fire
Comparisons of Brush Reduction Methods

- Cost
- Effectiveness
  - Amount removed
  - Selectivity
  - Regrowth
  - Predictability
- Availability of equipment and expertise
- Aesthetic appeal
- Habitat quality
- Air and water pollution

- Crews
- Chipping
- Grazing (goats)
Comparisons of Brush Reduction Methods

- Herbicides
- Prescribed Burning

■ Cost
■ Effectiveness
  ■ Amount removed
  ■ Selectivity
  ■ Regrowth
  ■ Predictability
■ Availability of equipment and expertise
■ Aesthetic appeal
■ Habitat quality
■ Air and water pollution
Costs of improper or excessive clearance

- Erosion
- Slope instability
- Invasive weeds
- Increased flashy fuels
- Increased annual maintenance costs
- Future water availability and price

- Habitat destruction
- Alienation from the natural environment
Other Considerations
When Altering Landscape

- Protected species
  - Federal, state regulations can restrict clearing in potential habitat
- Contact US Fish and Wildlife Service and California Department of Fish and Game prior to projects in potential habitat
- 1997 Memorandum of Agreement with wildlife and fire agencies
Timing affects habitat

For example, in nesting areas of Coastal California Gnatcatcher, brush management cannot occur during nesting season February 15 – August 15
Recurring Costs

- Pruning and maintenance
- Irrigation
- Annual weed management
- Revegetation of bare slopes to horticultural or native plants

For ignition-resistant structures
- Risks from radiation is negligible beyond 100 feet
- Benefits low, costs very high
Private Property Responsibilities

- Homeowners
- Property owners
- Landscape contractors
- Developers
- Community organizations
  - FireSafe Councils
  - Homeowners’ associations
  - Canyon Friends’ groups
Regulatory Authorities

- Fire protection districts
- California Department of Forestry and Fire Protection
- US Fish and Wildlife Service and Calif. Department of Fish and Game
- Regional Water Quality Board
- Public land managers (Forest Service, Refuges, BLM)
Advice About Inspections

- Notices sent by county in the spring
- Ask local code citation
- Ask how recommended vegetation removal will affect erosion and weeds
- CALFIRE emphasizes vegetation close to structure
- Some fire protection district inspections focus only on fuel reduction
- “Be your own advocate”
Advice About Hiring Contractors

- Include language from local codes in contract
- Ask landscape architect, gardener or biologist to review contractor’s bid
- Remove no roots, and nothing below 18” (or 6” depending on code)
- Chip materials and leave on site
- OR organize “chipping day” and share chipper with neighbors
Difficult, Unresolved Situations

- Don’t be surprised if you don’t have answers when the public asks about.....
- Non-conforming existing structures
  - Wood siding, decks, roofs
- 100 feet extends onto neighbor’s property
- More than 100 feet demanded
  - Insurance companies
  - Subdivision plans
- More.....
More Unresolved Situations

- Prescribed fire
- Targeted goat grazing
- Coastal zone regulations
- Limited resources and time of local agency personnel
  - Open space managers
  - Fire marshals
- Conflicts in values/tradeoffs
Quick Quiz

- Look at the conditions in and around these 3 houses
- What actions are needed to reduce property risks?
Dead material in thick undergrowth

Brush next to firewood

Firewood under eaves

Defensible/Survivable Space

Goals:

- Reduce flame length and keep those flames from touching structure
- Reduce radiant heat that the structure is exposed to
- Allow emergency personnel room to maneuver, if present
- Reduce adverse effects on native habitats
Create sustainable, fire-safe environments for our homes by starting from the house out rather than from the wildland in.

- Community design
- Building design
- Landscape design
- Personal responsibility
Reminder: Home Design Features

- Class “A”, non-combustible roof assembly with edge protection
- Constructed of ignition-resistant materials
- Protected eaves
- Dual pane or tempered glass windows
- Fire-resistive landscape (well-maintained)
Why care?

Alienation from nature costs lives and property...
increases the risks to our families and the firefighters we expect to help us...
... and threatens the protection and preservation of nature for present and future generations.
Living with Wildfire:
Reducing Property Risks,
Habitat Losses, and Costs
